

Singles and couples side by side, equivalized

FINAL_COUPLES_PROVISIONAL_PENDING_ECONOMICS_REVIEW. Singles are the final singles model, female-reference arm; the male structural-zero arm is a sensitivity and the two are never averaged. Couples have NO reference-group arm: the couples specification estimates one shared preference vector with per-sex coordinates, so the reference block is that vector at the couples-medoid arguments. Levels are cross-type-comparable only in equivalized units (R-227 s9).
