

The nested geographic split of the job-access channel (final singles model, money-metric W_1)

Owen / level-structure contributions on the money-metric welfare measure W_1 , with the eight-scramble delete-one jackknife band $E_T = t(0.975, 7) \times se$. Geographic access = the NUTS-1 region indicators, the urbanisation indicators and the local unemployment rate; remaining access = the occupation-availability conditional and the survey-year indicators. $C_{geo} + C_{oth} = C_{acc}$ exactly, by construction of the level-structure value and asserted at machine precision. Structural and model-conditional; not causal. GEO_NESTED_ACCESS_PROVISIONAL_PENDING_ECONOMICS_REVIEW
