

Key coefficients against the draw count, in R = 100 robust-SE units

Final singles model, corrected frame; every number read from the estimation record, nothing re-estimated. The dotted guides are +/- 0.25 SE. NOTE ON "beta_E by sex": the final singles model carries ONE beta_E, common to both singles groups -- there is no sex-split pair to plot. The sex contrast in job access sits in beta_occ_{2,3,4}_{m,f}, which is why that panel is here. Occupation 1 is the omitted category in both the access and the wage-location blocks. Terminology: R-227 sec.12.
