

Welfare objects against the estimation draw count (corrected S8, female reference)

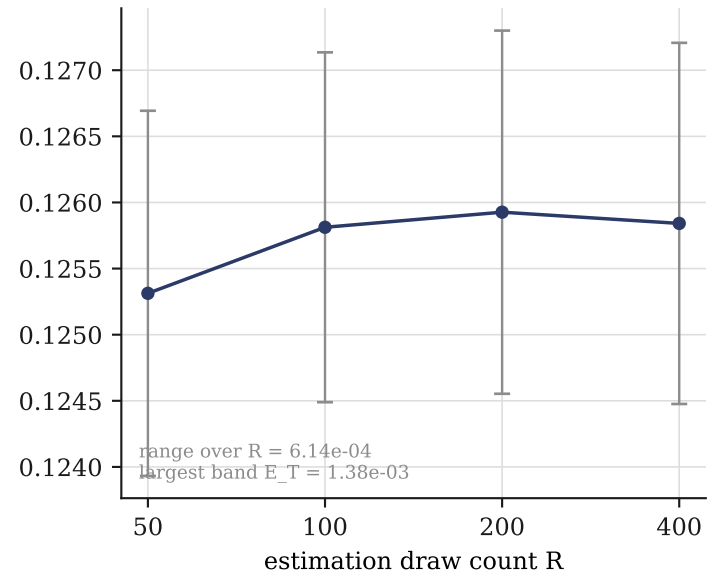

baseline welfare Gini I00

preference contribution C_P

environment contribution C_E

ONLY theta varies across R. The welfare basis is the same common-support 8 x 256 panel at every rung, so the ladder isolates the propagation of estimation-draw noise into the welfare decomposition. Error bars are the eight-scramble delete-one jackknife; note that the vertical bars measure quadrature error at a fixed theta, not sampling error in theta.
